Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Structural identity of Bence Jones and amyloid fibril proteins in a patient with plasma cell dyscrasia and amyloidosis.";
J. Clin. Invest. 52:1276-1281 (1973)
-I- MISCELLANEOUS: THE MAJOR AMYLOID PROTEIN APPEARS TO BE IDENTICAL WITH THE BENCE JONES PROTEIN ISOLATED FROM THE SAME PATIENT.
-I- MISCELLANEOUS: THIS PROTEIN WAS ISOLATED FROM THE URINE OF A PATIENT WITH PLASMA CELL DYSCRASIA AND AMYLOIDOSIS.
-I- MISCELLANEOUS: THE C REGION OF THIS CHAIN HAS THE INV (1,2)

```
The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The comprisions are useful for inhibiting the interaction of a call expressing CR2. They are useful for inhibiting the interaction of a call expressing CR2. They are useful for inhibiting of treating CR2 mediated disorders such as shewcyte trafficking, for treating CCR2-mediated disorders such as rheumatorid arthritis and multiple sclerosis, atherogenesis and atherosclerosis, and for inhibiting restenosis. They are useful in therapy or diagnosis, and in the manufacture of a medicament for treating allergy, anaphylaxis, and in the manufacture of a medicament for treating allergy, anaphylaxis, and in the manufacture of a medicament for treating allergy, anaphylaxis, consistent allergy and allergic reaction, shock, seroosis, allograft rejection, ender fibrotic disease, asthma, inflammatory glomenlopathies, acquired immune deficiency syndrome (AIDS), restenosis associated with vascular threevention, including angioplasty and/or stent placement in a mammal. The present sequence is mouse germline kappa light chain variable of the present sequence is mouse germline kappa light chain variable
                                                          Humanized immunoglobulin for treating a CC-chemokine receptor 2-mediated disorder in a patient, comprises a binding specificity for CCR2, and a non-human antigen binding region and human immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CD23; FCERII; IgB receptor; monoclonal antibody; C11; mouse; human; monoclonal antibody; chimeric antibody; humanised antibody; complementarity determining region; CDR; autoimmune disease; inflammation; arthritis; lupus erythematosus; multiple sclerosis; inflammation; arthritis; lupus erythematosus; multiple sclerosis; urflammation; they providate; diabetes; uvaitis; dermatitis; psoriasis; urticaria; nephrotic syndrome; glomerulonephritis; drohn's disease; inflammatory bowel disease; ulcerative colitis; Crohn's disease; graft-versus-host disease; CDP; bronchitis; eczema; insulitis; graft-versus-host disease; COPD; bronchitis; diabetes;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .<del>.</del>
                                                                                                                                                                                               This sequence represents complementarity determinating region 1 (CDR L1) of the light chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (see also AAY32262). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of C11 light and heavy chain CDRs (see AAY3224-59) to render them capable of binding to the CD23 type II molecule expressed on heematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, are used to block soluble CD23 formation for treatment of arthritis, clubus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, dabetes, uvatis, demantils, psoriasis, multiple sclerosis, diabetes, graftome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogrem's syndrome, allergies, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, eczema, graft-versus-host disease, COPD, insulitis, bronchitis diabetes, and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and

 This sequence represents the light chain variable region (VL) of humanised anti-CD23 (FCERII) monoclonal antibody C11, composed of a human framework (HSIGNYII) and the light chain complementarity determining regions (see AAY32254-56) of murine antibody C11. The DNA was constructed by splice overlap PCR. The invention provides attered antibodies, such as chimacis or humanised antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on hamanised of binding to the CD23 type II molecule expressed on hamanised of binding to the CD23 for the treatment of arthritis, charactoris, dermatitis, porthas thyrologism scolers, republication in human therapy, for the treatment of arthritis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, crohn's disease, Sjogram's syndrome, allergies, allergic asthma, intrinsic asthma, acute asthma, and secandary type I charactes), and B-cell malignancies (Claimed). They are also useful for studying interactions between CD23 and various ligands and

This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCERII) monoclonal antibody Cll. The invention provides altered antibodies, such as chimeric or humanised antibodies (see AAV32262 and AAV32263), which comprises sufficient of the amino acid sequences of the Cll light and heavy chain complementarity determining regions (see AAV32454-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble complements in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, sjogren's syndrome, allergic asthma, intrinaic asthma, acte asthmatic exacerbation, rhintis, ecema, graft-versue-host disease, COPD, insultis, insultis,
Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -

The present sequence represents the light chain of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were presented and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be

A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-bancoic acid from 3H-phenyl cocaine. The 6A12 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6A12 has a per minute Kcat 60 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).

It is used in the construction of a chimeric MAD comprising heavy and light chains having murine V regions and human C regions. The chimeric MADs are more effective than murine MAD beavy and light chain V-regions are more effective than murine MAD heavy and light chain V-regions to generate restriction enzyme recognition sites. The chimeric MADs can be used as immuno-conjugates, in association with e.g. toxins for HIV treatment. They can also be used in diagnosis of HIV.
                                                                                        þe
                             The mouse VL gene product may be used to produce chimeric mouse-human Abs against HIV-1 comprising human Ig constant regions and murine variable regions. These novel sequence are useful in treatment, diagnosis and prophylaxis of HIV infections, and may k produced by a bacterial, yeast or mammalian expression system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô

                                                                                                                                                                                                                                                                                                                         of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2AlO antibody (AAW39809 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoseter transition state analogue. Antibody 2AlO has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can

AAW39924-26 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 12H1, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSA2, and has a per minute Kcat of 0.16. The antibody particularly for the treatment of an overdose. They are also used for treatment of an overdose. They are also used for treatming addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Variable domain; lambda light chain, catalytic antibody; degradation, cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction
                                        Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue, TSA, benzoic acid; phenyl cocaine, immunogenic conjugate, reduction, cocaine, treatment; overdose; addiction.
                                                                                                                                                                                                                                                                                                                                                                   New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 92.6%; Score 75; DB 19; Length 16

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 189, which is able to degrade occaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Gatalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl occaine. The 389 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoseter transition state analogue. Antibody 389 has a per minute Koat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         used for treating addiction (by reducing the in vivo concentration that can be achieved).

AMW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-bhenyl cocaine. The JBS antibody (AMW39806 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be

A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl accaine. The 12H1 antibody (AAM39808 represents the heavy chain) was identified using TSA2, and has a per migute Kcat of 0.016. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6A12 antibody (AAW39807 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6A12 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

RESULT 1

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
